

AMPHETAMINES

Street Names: speed, uppers, bennies, whizz, and black beauties. These are some names that people use to talk about drugs that make you feel super energized and focused.

Amphetamines are drugs that give you a lot of energy and make you more alert, can be called different things depending on where you are and who you hang out with: These are some names you should know:

- **Speed:** This name comes from the fact that these drugs can make you feel like you're going really fast and give you a lot of energy.
- **Uppers:** This name is used because amphetamines can make you feel really happy and excited.
- **Addys:** This name comes from a specific brand of amphetamines called Adderall, which is used to help people with ADHD.

These are just a few examples, but there are many other slang words for amphetamines out there, so it's important to stay informed and know what people might be talking about.

Signs to look out for:

Here are some signs that can show if someone is using amphetamines. Their pupils might look bigger; they might be really sweaty and have a high body temperature. They might breathe really fast and not want to eat, which can make them lose weight. Sometimes, they might do repetitive movements or act really nervous. You might also notice that their teeth aren't in good shape, their skin is not healthy, and they look different than before. Strong cravings and compulsive drug-seeking behaviour might be present, followed by neglecting responsibilities and hobbies due to drug use. Users will develop a tolerance and need larger doses to achieve the desired effect. Withdrawal symptoms will occur when attempting to quit

Effects:

Right after taking amphetamines, your body gets a big boost. It wakes up your brain and makes you feel super alert and full of energy. You might not feel hungry and your heart might beat faster. Some people even feel really happy and confident. But remember, these effects can be different for everyone

depending on how much they take and how they take it. Using amphetamines can also mess with your mind. It can make you feel really anxious, angry, and paranoid. You might get obsessed with doing things or talk a lot more than usual. After a while, it can even make you feel really sad with mood swings. Sometimes, you might hallucinate (start seeing things that aren't real). It is important to pay attention to these signs because they can help you know if someone is using too much amphetamine.

Different Ways to Use Amphetamines

If you're curious about how people use amphetamines, here are a few ways. The most common way is by swallowing them. You just take a tablet or capsule and let it go through your tummy. It takes a bit longer for the effects to kick in, but they can last for a good few hours.

Another way is by snorting them through your nose. People crush the amphetamines into a powder and then sniff it up. This way, the drug gets into your bloodstream faster, so you feel the effects quicker. The more intense way is intravenous use. This means injecting the amphetamines directly into your bloodstream with a needle and syringe. It gives you a fast and strong high, but is also really risky. You can easily overdose or catch diseases this way, so it's definitely not safe as you have no control over it. Other people also smoke amphetamines or put them in their butt, but those methods are not as common.

Risks of Amphetamine Abuse

Amphetamines can provide temporary euphoria and increased energy, but also come with a range of risks and dangers. Some potential physical risks associated with amphetamine abuse include:

- Increased heart rate and blood pressure: Amphetamines can put a strain on the cardiovascular system, leading to heart problems and hypertension.
- Insomnia and sleep disturbances: The stimulant effects of amphetamines can disrupt sleep patterns, leading to chronic sleep deprivation and fatigue.
- Appetite suppression and weight loss: Amphetamines often reduce appetite, which can result in unhealthy weight loss and malnourishment.
- Increased anxiety and paranoia: Amphetamines can intensify feelings of anxiety and induce paranoia, leading to distress and psychological discomfort.
- Mood swings and irritability: Amphetamine abuse can cause rapid changes in mood and heightened irritability, negatively impacting personal relationships and overall emotional well-being.
- Psychological dependence: Regular amphetamine use can lead to psychological dependence, making it challenging to function without the drug.

Engaging in illegal activities related to amphetamine use can result in significant legal repercussions. Possession, distribution, or manufacturing of amphetamines are criminal offenses in many jurisdictions. Legal consequences can include fines, probation, and even imprisonment.

Understanding the legal risks involved can help individuals make informed decisions and consider the potential consequences before engaging in amphetamine-related activities.
